

IN THE CLAIMS:

Please cancel Claims 1 to 86 and add new claims 87 to 104. The claims, as pending in the subject application, now read as follows:

1. to 86. (Canceled)

87. (New) A computer program product having a computer readable medium storing a printer driver program which generates print data to be transmitted to a printer based upon data obtained from an operating system, said program comprising:

a database including plural tables; and

a program module for loading a table corresponding to a printing mode from said database and performing processing using the loaded table.

88. (New) The computer product according to claim 87, wherein said table includes a color correction table and said program module loads the color correction table corresponding to the printing mode from said database and performs color correction processing using the loaded color correction table.

89. (New) The computer product according to claim 87, wherein said table includes a color conversion table and said program module loads the color conversion table corresponding to the printing mode from said database and performs color conversion processing using the loaded color conversion table.

90. (New) The computer product according to claim 87, wherein said table includes a grayscale correction table and said program module loads the grayscale correction table corresponding to the printing mode from said database and performs grayscale correction processing using the loaded grayscale correction table.

91. (New) The computer product according to claim 97, wherein said table includes a dither matrix table and said program module loads the dither matrix table corresponding to the printing mode from said database and performs dither processing using the loaded dither matrix table.

Q. 92. (New) The computer product according to claim 87, wherein said table includes a margin table and said program module loads the margin table corresponding to the printing mode from said database and performs margin processing using the loaded margin table.

93. (New) A data processing method for a printer driver which generates print data to be transmitted to a printer based upon data obtained from an operating system and having a database including plural tables and a program module, said method comprising:

a loading step of loading a table corresponding to a printing mode from said database; and

a performing step of performing processing using the loaded table.

94. (New) The data processing method according to claim 93, wherein the table includes a color correction table, said loading step loads the color correction table corresponding

to the printing mode from said database and said performing step performs color correction processing using the loaded color correction table.

95. (New) The data processing method according to claim 93, wherein the table includes a color conversion table, said loading step loads the color conversion table corresponding to the printing mode from said database and said performing step performs color conversion processing using the loaded color conversion table.

96. (New) The data processing method according to claim 93, wherein the table includes a grayscale correction table, said loading step loads the grayscale correction table corresponding to the printing mode from said database and said performing step performs grayscale correction processing using the loaded grayscale correction table.

Q. 97. (New) The data processing method according to claim 93, wherein the table includes a dither matrix table, said loading step loads the dither matrix table corresponding to the printing mode from said database and said performing step performs dither processing using the loaded dither matrix table.

98. (New) The data processing method according to claim 93, wherein the table includes a margin table, said loading step loads the margin table corresponding to the printing mode from said database and said performing step performs margin processing using the loaded margin table.

99. (New) . A computer having a printer driver which generates print data to be transmitted to a printer based upon data obtained from an operating system, said computer comprising:

a database including plural tables; and

a program module for loading a table corresponding to a printing mode or a printing condition from said database and performing processing using the loaded table.

100. (New) The computer according to claim 99, wherein said table includes a color correction table and said program module loads the color correction table corresponding to the printing mode from said database and performs color correction processing using the loaded color correction table.

a,
101. (New) The computer according to claim 99, wherein said table includes a color conversion table and said program module loads the color conversion table corresponding to the printing mode from said database and performs color conversion processing using the loaded color conversion table.

102. (New) The computer according to claim 99, wherein said table includes a grayscale correction table and said program module loads the grayscale correction table corresponding to the printing mode from said database and performs grayscale correction processing using the loaded grayscale correction table.

103. (New) The computer according to claim 99, wherein said table includes a dither matrix table and said program module loads the dither matrix table corresponding to the printing mode from said database and performs dither processing using the loaded dither matrix table.

Q1

104. (New) The computer according to claim 99, wherein said table includes a margin table and said program module loads the margin table corresponding to the printing mode from said database and performs margin processing using the loaded margin table.
